

Launch

Instructions

The Tbar can be mounted in 1 of 3 positions to ride. The longest is 39" for the tallest Hydrofoil strut available on the market. As you lower the strut to 37 1/2" or 36" you will find the lift slightly increases. This is because of the decrease in leverage from the rope pull on the wings. If it is uncomfortable add a shim washer under the rear wing to decrease the lift. If you want more lift then add a shim to the front of the rear wing.

Both front and rear wings are a new design developed over the winter with a "Bat" profile. You will notice a much smoother ride and greater acceleration for less effort when you want to jump. This ski redefines skidders and they are now a whole new game!

Front wing can be mounted in the forward or rear position to tailor the ride. The forward position will give you more lift and pop out of the water. The rear position is slightly quicker reacting, but has less lift and the "pop" will not be as high for the same amount of effort.
